**BALANCING SEC 5.7**Code: **AEQ01XSXX0064**

The automatic balancing machine SEC 5.7 is equipped with a large display monitor, with a large ergonomic weight tray and with an intuitive graphic. Its automatic calliper allows the electronic acquisition of distance and diameter (up to 28"). This machine allows you to work according to the operator's preferences. The correct positioning of the weights can be shown in one of these three ways: with the relay precision, with the speed of laser, with the conventional 12 o'clock. The wheel is blocked while in correcting position thanks to the electric brake and the laser line. It can therefore guarantee a quick and simple placing of the weights. Tightening is fast and steady. The 4 wheel set is balanced under the same conditions

(SE version) and the LA sonar device allows an instant acquisition of all the necessary parameters
